PROJECT CONCEPT REPORT

OfficeVerse AI

A virtual corporate office where four AI employees plan, research, create and review real work - inside an interactive 3D world.

4 AI EMPLOYEES

INTERACTIVE 3D OFFICE

REAL TASK WORKFLOWS

Concept: premium pastel-pink and white office design, cute robotic employees and a genuine AI task workflow. Prepared as a product explanation, not a coding guide.

What is OfficeVerse AI?

A simple explanation of the product: what the user sees, what the AI does and why the 3D office matters.

THE IDEA IN ONE SENTENCE

OfficeVerse AI is a virtual office where you give a task to a team of AI employees, watch their work status in 3D, and receive a real deliverable at the end.

1 Explain it like I am new to AI

Imagine you own a small digital company. Instead of doing every step yourself, you give a job to an office manager. The manager divides the job between a researcher, a creator and a reviewer. Each employee has a defined responsibility, and their results are passed to the next employee when needed.

What makes it special

- A full 3D office, not just a flat dashboard.
- Each robot has a different job and visible status.
- The AI must create useful work outputs.
- Review and correction are part of the workflow.

What it is not

- Not a factory or warehouse simulator.
- Not a static image pretending to be 3D.
- Not four random chat windows with no teamwork.
- Not a promise of human-level autonomous employees.

The most important product rule

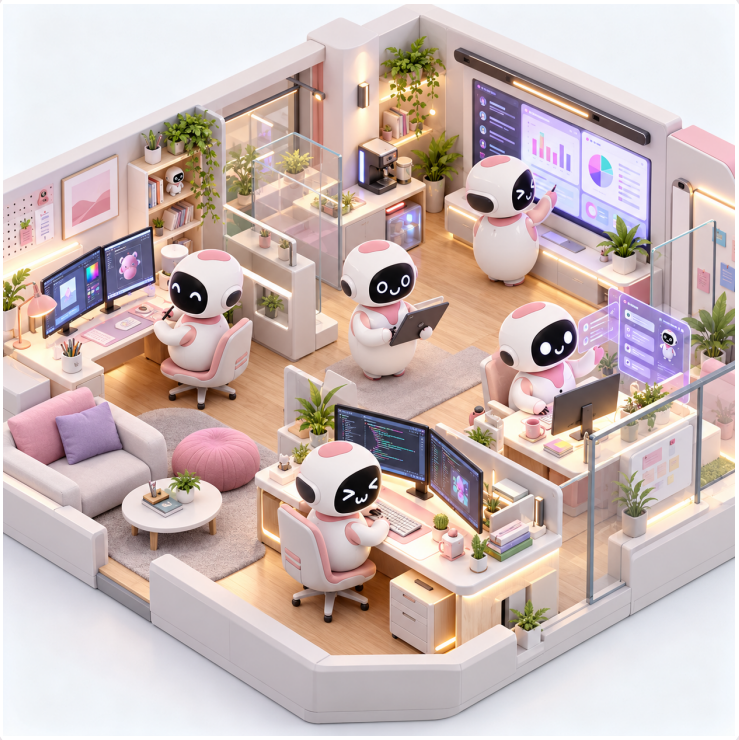

The visual animation and the AI work must be connected. If the Researcher is actually researching, the office should show the Researcher as working. If the API fails, the app must show an error - it must not pretend the task succeeded.

PRODUCT FIRST

The office is the experience; the AI workflow is the engine underneath it.

The office: look and feeling

The reference image defines the visual direction. The target is a warm, premium miniature office - not a cold industrial lab.

Visual identity

Soft, friendly and polished. Robots should look like small professional teammates: smooth white bodies, pastel-pink accents and expressive black digital faces.

Colour palette

- Pastel pink
- Warm white
- Wood
- Lavender
- Mint

Lighting and camera

Warm desk lights, soft shadows, glass reflections and an isometric upper-angle camera. Users can zoom in to inspect an employee and zoom out to see the whole office.

2 What the office contains

A — Entrance and reception

A small, welcoming arrival area.

B — Four employee desks

Distinct workstations with monitors and role identity.

C — Team dashboard wall

Shared task progress and office activity visual.

D — Glass meeting room

A place for visible team coordination moments.

E — Comfort details

Plants, shelves, sofa, rug and small desk objects.

Visual target

Match the reference in composition and mood. Build real 3D geometry and materials, but treat an exact pixel-for-pixel match as a stretch goal - the supplied picture is a rendered reference, not a ready-made 3D model.

Meet the four AI employees

Each employee has a clear responsibility. Their personalities can be friendly, but their work must be traceable and useful.

AURA

OFFICE MANAGER

Plans and coordinates

Understands your goal, splits it into tasks, tracks dependencies and routes work to the right employee.

- Produces a task plan
- Tracks progress and blockers

VISIBLE STATE: Planning / coordinating

NOVA

RESEARCHER

Finds and organizes information

Collects research from available sources or documents, separates facts from assumptions and gives notes to the Creator.

- Produces research notes
- Includes source references when available

VISIBLE STATE: Researching / reading

PIXEL

CREATOR

Turns plans into deliverables

Uses approved task requirements and research to draft reports, documents, code or other requested outputs.

- Creates real files
- Reports what is unfinished

VISIBLE STATE: Writing / creating

ORBIT

QUALITY REVIEWER

Checks work against requirements

Checks completeness, consistency and obvious defects. Sends precise correction requests when output needs improvement.

- Produces a review result
- Requests a limited revision when needed

VISIBLE STATE: Reviewing / checking

Team rule: The employees do not automatically know everything. They receive relevant task context, use permitted tools, return evidence or outputs, and update the shared task state.

One task, from instruction to result

Example workflow: prepare a useful college project report. The same pattern can support research summaries, document drafting and code tasks.

YOUR COMMAND

"Research an AI cybersecurity project and prepare a structured report for my college."

01

AURA plans

Turns the request into clear subtasks and identifies dependencies.

02

NOVA researches

Collects useful information and notes where claims came from.

03

PIXEL creates

Builds the report draft and saves an actual deliverable file.

04

ORBIT reviews

Checks the draft against the original request and flags gaps.

05

AURA delivers

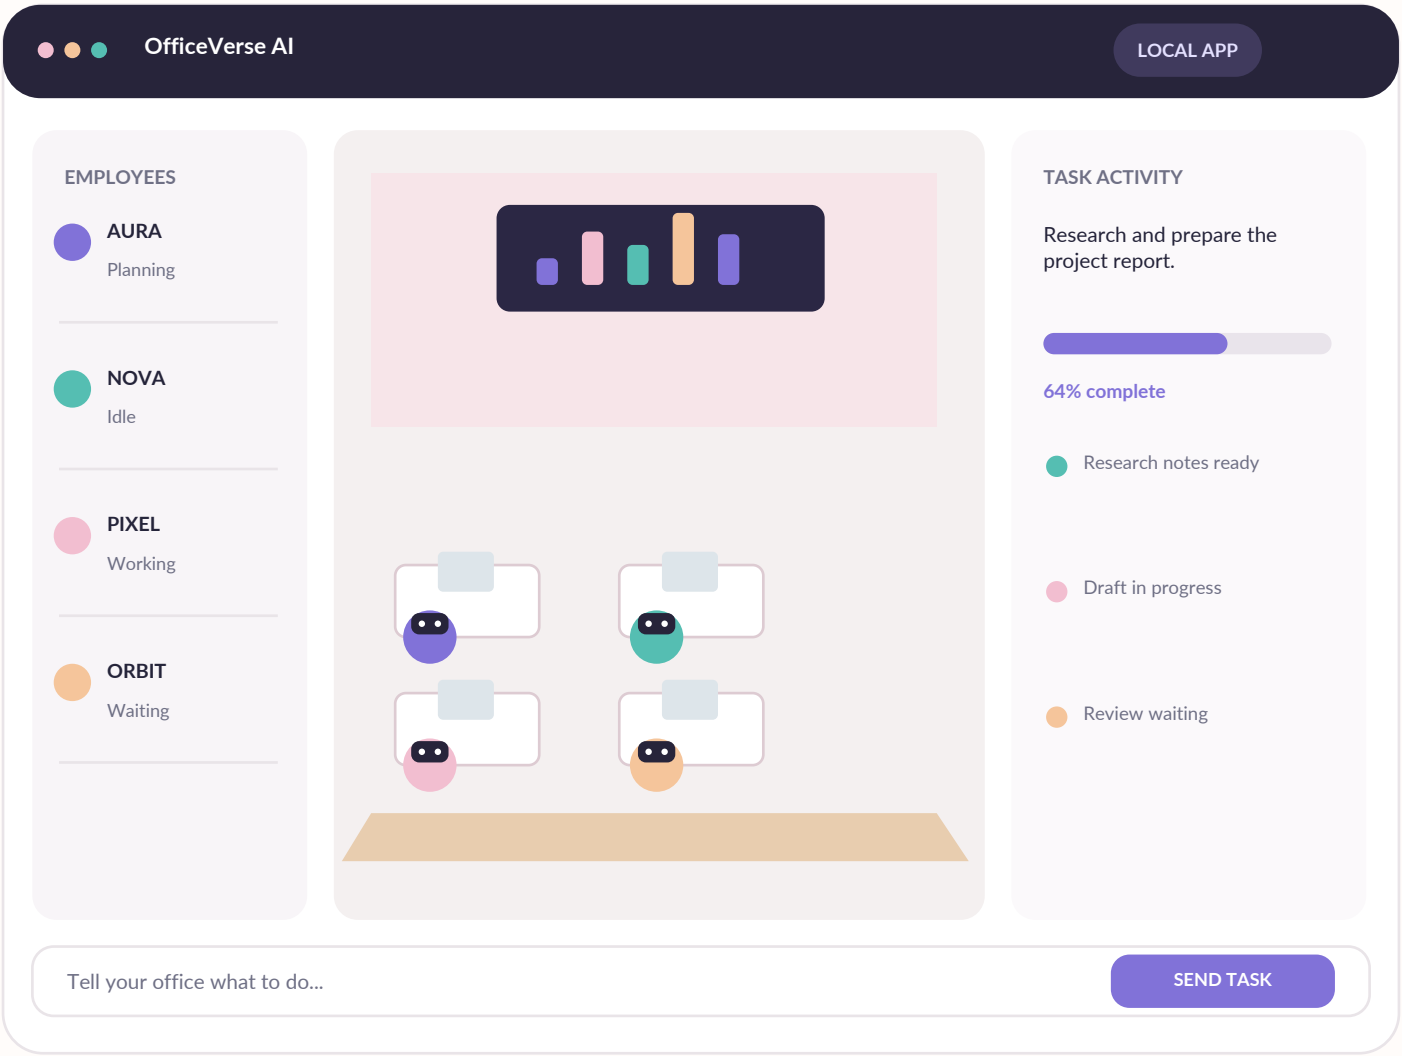

Returns the final output, review summary and task history.

If the reviewer finds a problem

ORBIT returns a specific correction request. PIXEL gets the feedback and updates the draft. The reviewer checks it again once. If it still fails, the task is marked as needing human attention instead of looping forever.

The user experience

The 3D office is the main stage. The surrounding panels make it easy to give tasks, see progress and get the result.

01

Command panel

Write a task in natural language.

02

Employee details

Click a robot to see role and status.

03

Activity + files

Follow progress and download results.

The screen above is a conceptual layout, not a claim that the software is already implemented. Its purpose is to define the intended user experience clearly.

How the virtual office works

Simple mental model: one part shows the office, another part manages tasks, and AI agents perform the actual reasoning and creation.

VISIBLE LAYER

3D world and interface

Shows the office, employees, screens, task progress and activity timeline. It reads the real task state and changes the relevant robot animation. It does not decide task success by itself.

WORK LAYER

Task coordinator and AI employees

Receives the user request, asks the Manager for a plan, invokes the appropriate specialist, checks the returned result, records events and passes outputs between tasks. Gemini provides AI capabilities; application logic manages workflow and limits.

1 The flow underneath

USER	MANAGER	SPECIALIST	REVIEWER	RESULT
Instruction	Plan	Research / create	Check	File + summary

What Antigravity does vs. what the final app does

Antigravity IDE helps create and test the software. OfficeVerse AI is the application you will run after it is built. The office employees must be connected to a supported agent/API service at runtime; the IDE coding agent does not automatically become the app's employees.

Trust rule: If an AI call fails, output is invalid, or the quota is exhausted, show a clear failure/waiting state. Never turn an error into a fake success animation.

Features and realistic boundaries

The first version should be useful and believable. Advanced capabilities can be added later, after the core workflow is reliable.

Core version

- Interactive 3D office and four selectable employees.
- Natural-language task submission.
- Task planning and assignment to the right role.
- Research notes, documents, reports or code drafts.
- Reviewer feedback and one controlled revision.
- Task history, visible errors and downloadable files.
- Mock mode for testing UI without API calls.

Later enhancements

- Voice instructions and spoken status updates.
- Persistent task memory across sessions.
- More specialised roles such as Designer or Analyst.
- Export to PDF and richer document formats.
- Optional integrations with cloud drives or project tools.
- Team performance summaries and reusable workflows.

1 Things the project should not pretend to do

Research	A source must be provided or genuinely retrieved. The app should distinguish facts from assumptions.
Code creation	Generated code is a draft until tested. It must not be executed automatically without approval.
Autonomy	Agents work within defined tools, task limits and permissions - not like unlimited human employees.
Availability	Model access, rate limits and API features depend on the configured account and can change.

The product is successful when it completes a small number of tasks honestly and consistently - not when it merely shows many animations.

What the finished project should prove

OfficeVerse AI is both a visual experience and a working multi-agent application. These are the signs that the concept has become real.

You open a beautiful miniature office, give a task to AURA, and see the work move through NOVA, PIXEL and ORBIT. The application returns an actual result and shows what happened along the way.

1 Definition of done

- [ ] The office is a genuine interactive 3D scene, not a flat picture.
- [ ] Each employee can be selected and has its own role and state.
- [ ] A submitted task creates a real task record and meaningful progress events.
- [ ] The manager delegates work and passes useful context between employees.
- [ ] The creator produces a real output file, and the reviewer checks it.
- [ ] API errors and quota issues are shown honestly and can be recovered from.
- [ ] The user can review activity history and download the finished deliverable.

A realistic first demonstration

Submit one clear task such as “prepare a short project report about defensive cybersecurity.” The Researcher returns sourced notes, the Creator turns them into a file, the Reviewer checks it, and the Manager delivers the result. In the 3D office, each robot's status changes to reflect these real events.

The long-term vision

A small virtual AI company that can grow over time: more employee roles, more task types, better memory and more integrations. The foundation, however, is always the same - clear responsibilities, real work, review and honest status.

OFFICEVERSE AI

Project concept report | Based on the supplied visual reference and the agreed four-employee office concept.
